FAST FOURIER TRANSFORM (FFT) ALGORITHM

Let the sequences $f[n]$ represent the even-numbered and $g[n]$ represent the odd-numbered samples of $x[n]$

$$f[n] = x[2n]$$

$$g[n] = x[2n + 1]$$

Since N-point DFT of $x[n]$ is, $X[k] = \sum_{n=0}^{N-1} x[n]W_N^{kn}$ $W_N = e^{-j(2\pi/N)}$ $k = 0, 1, \dots, N - 1$

If $x[n]$ is a sequence of even and finite length N where $x[n]=0$ $n < 0, n \geq N$ then

$$f[n] = x[2n] = 0 \quad n < 0 \quad f\left[\frac{N}{2}\right] = x[N] = 0 \quad \rightarrow \quad f[n] = 0 \quad n < 0, n \geq \frac{N}{2}$$

$$g[n] = x[2n + 1] = 0 \quad n < 0 \quad g\left[\frac{N}{2}\right] = x[N + 1] = 0 \quad \rightarrow \quad g[n] = 0 \quad n < 0, n \geq \frac{N}{2}$$

$$X[k] = \sum_{n \text{ even}} x[n]W_N^{kn} + \sum_{n \text{ odd}} x[n]W_N^{kn} = \sum_{m=0}^{(N/2)-1} x[2m]W_N^{2mk} + \sum_{m=0}^{(N/2)-1} x[2m+1]W_N^{(2m+1)k}$$

$$\text{Since } W_N^2 = (e^{-j(2\pi/N)})^2 = e^{-j(4\pi/N)} = e^{-j(2\pi/N/2)} = W_{N/2}$$

$$\rightarrow X[k] = \sum_{m=0}^{(N/2)-1} f[m]W_{N/2}^{mk} + W_N^k \sum_{m=0}^{(N/2)-1} g[m]W_{N/2}^{mk}$$

$$\rightarrow X[k] = F[k] + W_N^k G[k] \quad k = 0, 1, \dots, N-1$$

$$\left\{ \begin{array}{l} F[k] = \sum_{n=0}^{(N/2)-1} f[n]W_{N/2}^{kn} \\ G[k] = \sum_{n=0}^{(N/2)-1} g[n]W_{N/2}^{kn} \end{array} \right. \quad k = 0, 1, \dots, \frac{N}{2}-1$$

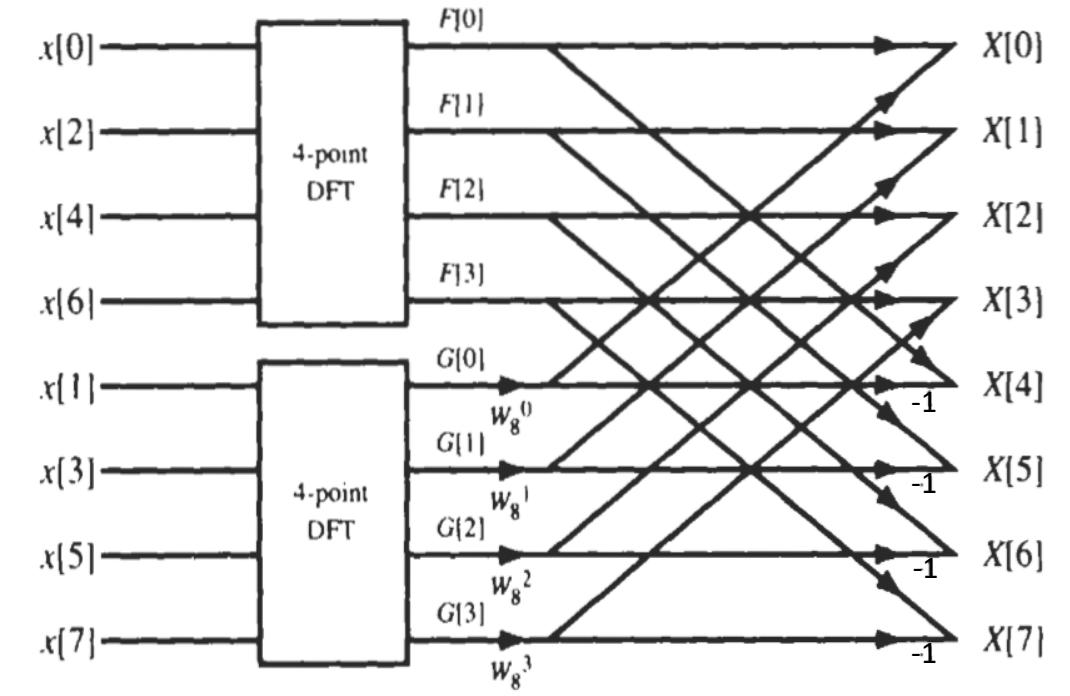

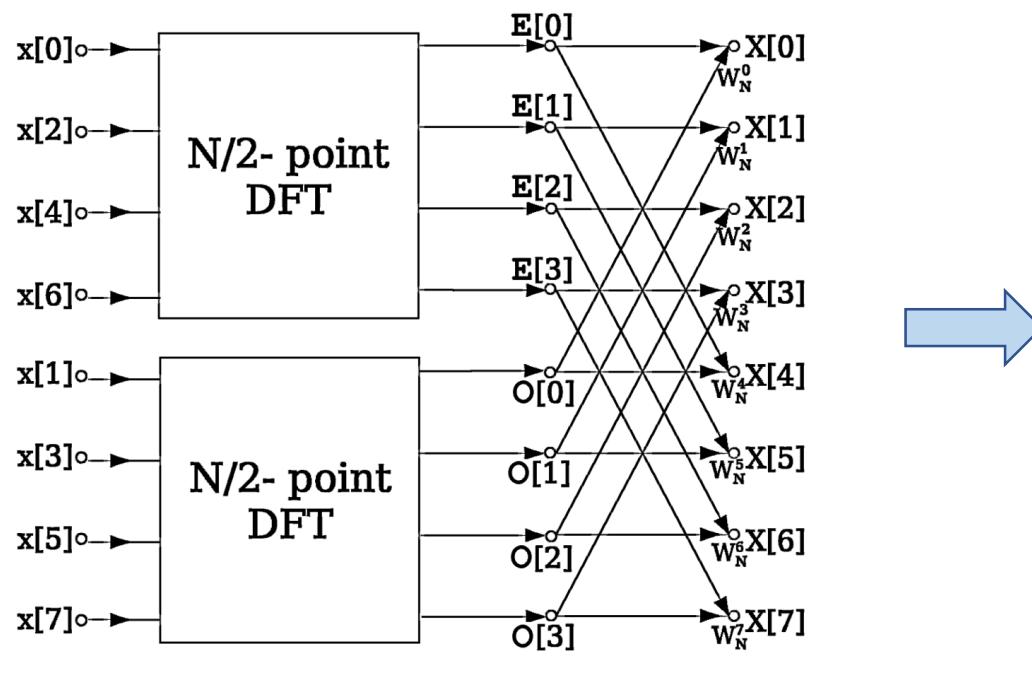

Where, $F[k]$ is $(N/2)$ -point DFTs of $f[k]$
 $G[k]$ is $(N/2)$ -point DFTs of $g[k]$

$$\text{Since } W_N^{N/2} = (e^{-j(2\pi/N)})^{(N/2)} = e^{-j\pi} = -1 \rightarrow W_N^{k+N/2} = W_N^k W_N^{N/2} = -W_N^k$$

$$X[k] = F[k] + W_N^k G[k] \quad k = 0, 1, \dots, \frac{N}{2}-1$$

$$X\left[k + \frac{N}{2}\right] = F[k] - W_N^k G[k] \quad k = 0, 1, \dots, \frac{N}{2}-1$$

Flow graph for an 8-point decimation-in-time FFT algorithm

Time Complexity Reduction:

Total number of complex multiplications based on $X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn}$ is N^2

Number of complex multiplications in evaluating F[k] or G[k] is $(N/2)^2$

Inverse DIT-FFT

A signal sequence $x[n]$ is given as $x[n]=\{1, 2, 3, 4\}$ and $x[n] = 0$ elsewhere. DFT for the first four points and show that IFFT recovers the signal from the spectral representation.

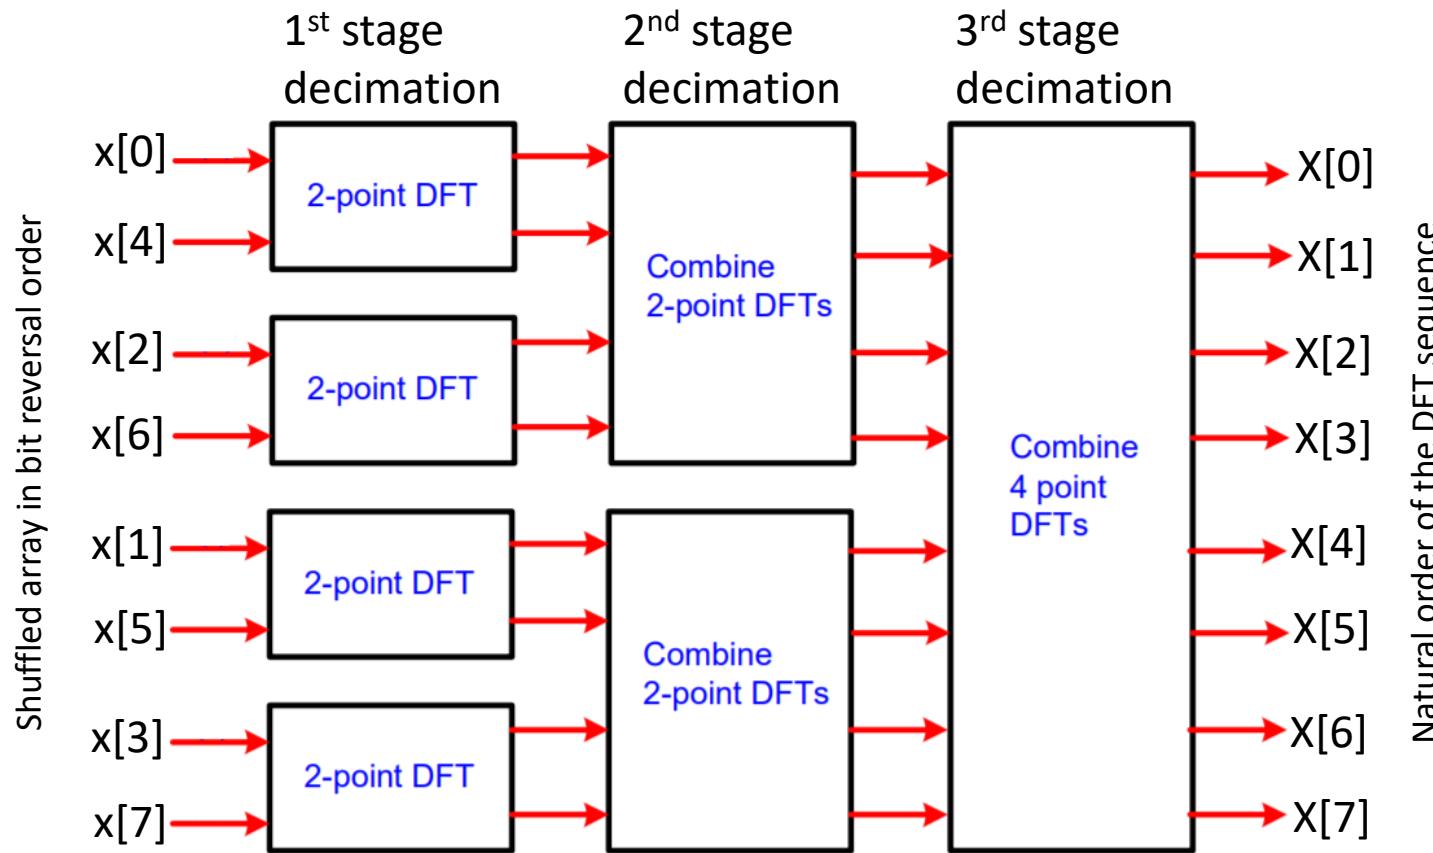

Inverse DFT can be calculated using the same method by changing the variable W_N and multiplying the result by $1/N$

FFT Algorithms

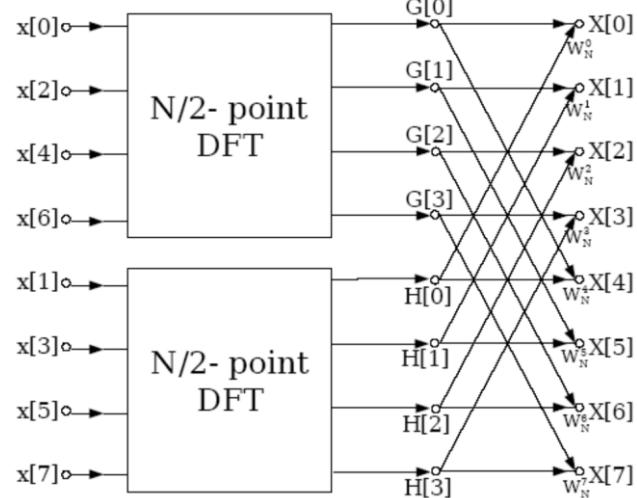

Radix-2 Algorithm

- Radix-2 is the most widely used FFT algorithm
- The sequence $x[n]$ of length N is factored in such a way that $N = r_1 r_2 r_3 \dots r_v$
- $r_1 = r_2 = r_3 = \dots r_v = r$ so that $N = r^v$, where r is called the radix of the FFT algorithm.
- $r = 2$ is called radix-2 algorithm

Decimation in Frequency FFT Algorithm

N-point DFT of $x[n]$ is,
$$X[k] = \sum_{n=0}^{N-1} x[n] W_N^{kn} \quad W_N = e^{-j(2\pi/N)} \quad k = 0, 1, \dots, N-1$$

If $x[n]$ is a sequence of even and finite length N where $x[n]=0 \quad n<0, n\geq N$ then

$$p[n] = x[n] + x\left[n + \frac{N}{2}\right] \quad 0 \leq n < \frac{N}{2}$$

$$q[n] = \left(x[n] - x\left[n + \frac{N}{2}\right]\right) W_N^n \quad 0 \leq n < \frac{N}{2}$$

$$X[k] = \sum_{n=0}^{(N/2)-1} x[n] W_N^{kn} + \sum_{n=N/2}^{N-1} x[n] W_N^{kn}$$

$$X[k] = \sum_{n=0}^{(N/2)-1} x[n] W_N^{kn} + W_N^{(N/2)k} \sum_{m=0}^{(N/2)-1} x\left[m + \frac{N}{2}\right] W_N^{km}$$

*variable change
 $n = m + N/2$*

$$W_N^{N/2} = (e^{-j(2\pi/N)})^{(N/2)} = e^{-j\pi} = -1 \rightarrow W_N^{(N/2)k} = (-1)^k \rightarrow X[k] = \sum_{n=0}^{(N/2)-1} \left\{ x[n] + (-1)^k x\left[n + \frac{N}{2}\right] \right\} W_N^{kn}$$

If k is even then by setting $k=2r \rightarrow X[2r] = \sum_{m=0}^{(N/2)-1} p[n] W_N^{2rn} = \sum_{n=0}^{(N/2)-1} p[n] W_{N/2}^{rn}$

N/2 point DFT of $p[n]$

$r = 0, 1, \dots, \frac{N}{2} - 1$

If k is odd then by setting $k=2r+1 \rightarrow X[2r+1] = \sum_{m=0}^{(N/2)-1} q[n] W_N^{2rn} = \sum_{n=0}^{(N/2)-1} q[n] W_{N/2}^{rn}$

N/2 point DFT of $q[n]$

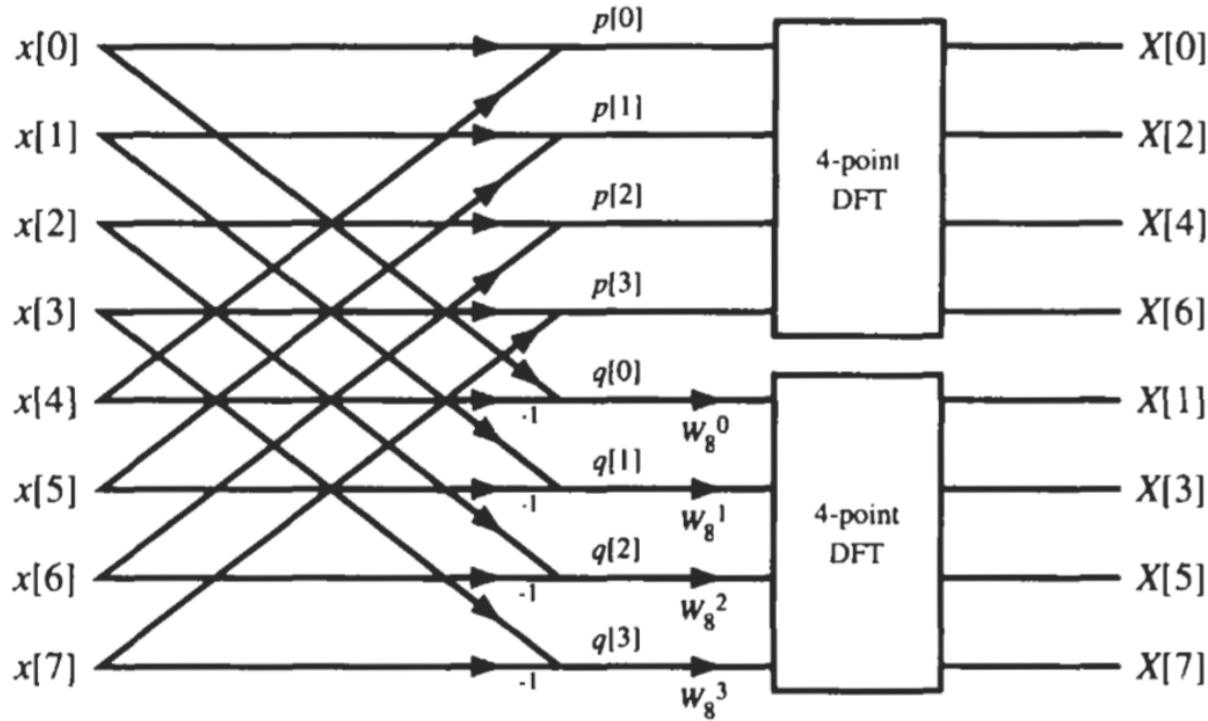

$r = 0, 1, \dots, \frac{N}{2} - 1$

If r is replaced by k then:

$$X[2k] = P[k] \quad k = 0, 1, \dots, \frac{N}{2} - 1 \quad \text{where} \quad P[k] = \sum_{n=0}^{(N/2)-1} p[n] W_{N/2}^{kn} \quad k = 0, 1, \dots, \frac{N}{2} - 1$$

$$X[2k+1] = Q[k] \quad k = 0, 1, \dots, \frac{N}{2} - 1 \quad \text{where} \quad Q[k] = \sum_{n=0}^{(N/2)-1} q[n] W_{N/2}^{kn} \quad k = 0, 1, \dots, \frac{N}{2} - 1$$

DIF-FFT Graph:

Comparison of DIT-FFT and DIF-FFT:

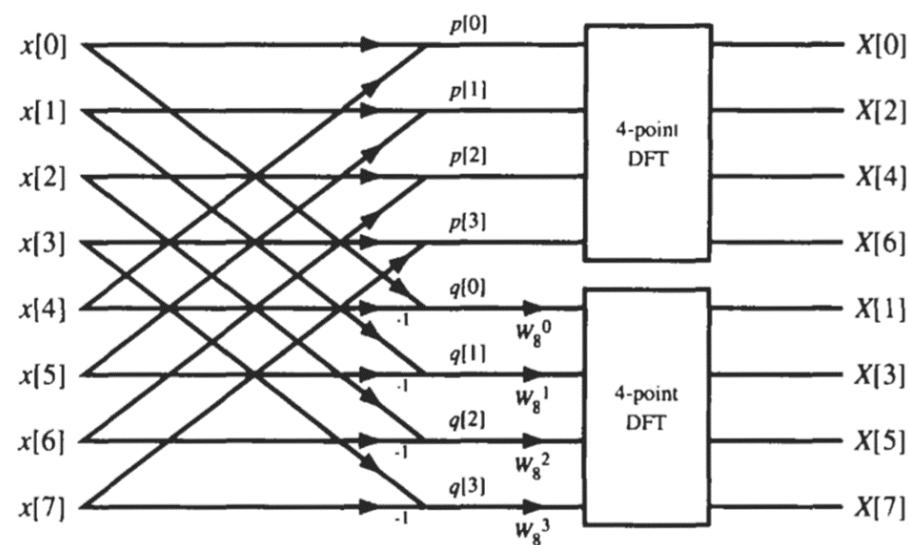

- DIT-FFT algorithm reduces the number of complex multiplications required from N^2 to $N \cdot \log_2(N)$, whereas DIF-FFT algorithm reduces the number of complex multiplications from N^2 to $(N/2) \cdot \log_2 (N)$
- Input is bit reversed in DIT-FFT while the output is in natural order, whereas in DIF-FFT, input is in natural order while the output is in bit reversal order.
- DIT-FFT refers to reducing samples in time domain, whereas DIF-FFT refers to reducing samples in frequency domain.
- DIT-FFT splits the two DFTs into even and odd indexed input samples, whereas DIF-FFT splits the two DFTs into first half and last half of the input samples.
- In DIT-FFT, butterflies are defined on the last pass of FFT, whereas in DIF-FFT, they are defined on the first pass of FFT

Time Complexity Advantage of DFT Convolution

Definition of convolution simplifies when working with finite sequences. If we assume that f and g have the same length N and they are periodic (f and g “wrap around”) then we get circular convolution:

$$h[x] = \sum_{t=0}^{N-1} f[t]g[x - t \bmod N] \quad \text{For } x = 0 \text{ to } N-1$$

Fourier transform of the convolution of two signals is the product of their Fourier transforms: $f * g \leftrightarrow FG$.
DFT of the circular convolution of two signals is the product of their DFT'

Convolution computing by its mathematical definition with a straightforward algorithm is expensive.
It requires N^2 multiplies and adds (MACs).

- ◊ If we use the FFT algorithm, then the two DFT's and one inverse DFT have a total cost of $6N \log N$ real multiplies
- ◊ Multiplication of transforms in the frequency domain has a negligible cost of $4N$ multiplies.
- ◊ Fourier convolution has time complexity advantage for large N . FFT improves this advantage rate.
- ◊ Circular convolution algorithm can be modified to do standard “linear” convolution by padding the sequences with zeros.
